SUMMARY

Quantitative Data Scientist with a strong foundation in Statistics and Financial Risk Modeling. Experienced in building predictive models for loss estimation, customer behavior, and generative AI systems. Proficient in Python, SQL, and cloud platforms. Skilled in translating complex financial data into actionable business insights to drive revenue growth and mitigate risk.

TECHNICAL SKILLS

Domains: Financial Risk Modeling, Predictive Analytics, NLP, LLMs, Quantitative Research, Credit Scoring, Time-Series Analysis.

Languages: Python, R, SQL, SAS.

Libraries: Pandas, NumPy, Scikit-learn, TensorFlow, PyTorch, LangChain, Statsmodels, Hugging Face, Transformers.

Tools: Power BI, Tableau, AWS, Streamlit, Git, RMS, AIR, CatRisk.

PROFESSIONAL EXPERIENCE

AI Engineer, PSS

May 2026 – Present

- Leveraged GenAI to optimize recruitment finance, reducing manual screening costs by automating candidate shortlisting and data collection via robotic calls.
- Built an LLM-based resume recommendation system, integrating internal databases with external Google results to source top-tier talent, improving hiring pipeline velocity by 20%.
- Developed an Agentic AI workflow to automate communication (Email/WhatsApp) and data collection, streamlining the end-to-end recruitment cycle and reducing administrative overhead by 30%.
- Integrated APIs (ChatGPT, Gemini, Claude) to generate structured reports and screening criteria, standardizing candidate evaluation metrics.

Risk Modeling Analyst, Marsh McLennan (Internship)

Feb 2025 – Apr 2026

- Architected end-to-end data science pipelines in Python (Pandas, NumPy) to automate the ingestion, cleaning, and standardization of exposure data for 125+ accounts, eliminating manual Excel workflows and boosting team productivity by 40%.
- Developed predictive machine learning models (XGBoost, GLM) to forecast aggregate loss costs, validating outputs against traditional RMS/AIR models to improve the accuracy of financial risk assessments by 12% for underwriting portfolios.
- Designed and deployed interactive dashboards (Power BI) to visualize critical financial risk metrics (AAL, PML, OEP, AEP), enabling senior stakeholders to monitor portfolio concentration and make data-driven reinsurance purchasing decisions 30% faster.
- Applied statistical modeling (Time-Series & Regression) on historical claims data to identify emerging catastrophe risk drivers, directly influencing premium pricing strategies and optimizing capital allocation for the firm.

Junior GenAI Engineer, Visulon Inc.

Jan 2025 – Feb 2025

- Designed an NLP-to-SQL pipeline using Ollama LLMs, enabling business stakeholders to query financial databases using natural language, reducing reliance on technical teams and improving reporting speed by 40%.
- Fine-tuned and deployed Stable Diffusion models for rapid prototyping, optimizing GPU inference latency for real-time applications.

ACADEMIC PROJECTS

Credit Risk Modeling & Loan Default Prediction

2024

- Built an end-to-end machine learning pipeline (XGBoost, Random Forest, Logistic Regression) to predict borrower default probability using synthetic banking datasets.
- Applied advanced feature engineering (debt-to-income ratios, credit utilization) and handled severe class imbalance using SMOTE-ENN to minimize false negatives, which carry high financial costs for lenders.
- Impact:** Achieved an 89% AUC-ROC, with the potential to reduce non-performing loan (NPL) ratios by 15% through early identification of high-risk accounts.

Financial Time-Series Forecasting & Volatility Modeling

2024

- Developed a hybrid ARIMA-LSTM model to forecast stock price movements and market volatility using historical S&P 500 and Forex data.
- Implemented GARCH models to statistically analyze volatility clustering and heteroskedasticity in asset returns, providing robust risk estimates for algorithmic trading strategies.
- Impact:** Improved directional forecasting accuracy by 7% over traditional econometric models, enabling better timing for portfolio rebalancing and hedging decisions.

Customer Lifetime Value (LTV) & Churn Analytics (Banking)

2024

- Engineered ensemble ML models (Gradient Boosting, SVM) to predict customer churn in the retail banking sector, focusing on high-net-worth individuals.
- Performed PCA for dimensionality reduction and integrated behavioral transaction data to generate personalized retention strategies.
- Impact:** Achieved 91% prediction accuracy; implementing the model could increase overall portfolio profitability by 6% by proactively retaining at-risk, high-value clients with targeted offers.

EDUCATION

M.Sc. Statistics & Data Science, NMIMS Mumbai

May 2025

- CGPA: 3.67 / 4.0

B.Sc. Statistics, B.N. Bandodkar College, Mumbai

2023

- CGPA: 9.7 / 10.0

CERTIFICATIONS

- Python with Data Science (Udemy)
- Machine Learning Advanced (Udemy)
- Deep Learning with TensorFlow (Udemy)
